CineMood Design System Report

CSE 4834 — UI/UX Design Lab

1 Introduction

This report presents the complete design system for **CineMood**, a mobile video streaming application designed for the CSE 4834 UI/UX Design Lab design system task. The assigned task was to design a complete design system for a video streaming application similar in category to Netflix or Amazon Prime Video, but with original and creative design decisions.

The system was built from scratch in Figma using reusable components, variants, interactive states, typography rules, color palette, icons, cards, navigation elements, alerts, and prototype interactions. The final design was created for an iPhone 17 mobile frame size of **402 × 874 px**.

CineMood is a movie-focused streaming application where users can browse movies, search and filter content, view detailed movie information, add movies to a watchlist, and play videos through a designed player interface. The purpose of the design system is to maintain consistency, reusability, scalability, and visual clarity across the app screens.

2 App Overview

2.1 App Name

CineMood

2.2 App Type

Mobile video streaming application focused on movies.

2.3 App Concept

CineMood is designed as a clean and modern mobile streaming app where users can discover, browse, save, and watch movies. The app provides a simple and visually organized interface for exploring movies through poster cards, genre filters, movie details, watchlist actions, and video playback controls.

The app uses a calm blue-based visual style, real movie poster references, rounded components, soft shadows, and clear typography. The design avoids unnecessary visual complexity and focuses on easy navigation and content discovery.

2.4 Target Users

The target users are mobile users who regularly browse and watch movies through streaming platforms. The interface is designed for users who prefer a simple, clean, and fast way to find movies, view details, save items, and start playback.

2.5 Main User Flow

The main prototype flow is:

1. The user starts from the Home screen.
2. The user browses featured and trending movies.
3. The user navigates to the Browse screen.
4. The user searches and filters movies using search, dropdown, checkbox, and genre chips.
5. The user opens a Movie Details screen.
6. The user adds the movie to My List.
7. The user taps Watch Now.
8. The user enters the Video Player screen.
9. The user can return to Movie Details or navigate to Profile.

3 Final App Screens Designed

The final Figma prototype contains five main screens.

3.1 Home Screen

The Home screen introduces the user to CineMood. It includes the top navigation bar, featured movie banner, continue watching section, and trending movie cards. This screen acts as the main starting point of the prototype.

3.2 Browse Screen

The Browse screen allows users to search and filter movie content. It includes a search input, genre dropdown, subtitle and 4K checkboxes, genre chips, and a grid of recommended movie poster cards. This screen supports vertical scrolling to match realistic mobile browsing behavior.

3.3 Movie Details Screen

The Movie Details screen presents detailed information about a selected movie. It includes a movie poster, title, release year, genre, duration, rating, genre chips, storyline, Watch Now button, My List button, success alert, and similar movie suggestions.

3.4 Video Player Screen

The Video Player screen provides a cinematic playback interface. It includes a dark video background, movie title, central play button, timeline progress bar, time indicator, play/pause button, backward and forward controls, subtitle control, settings icon, and fullscreen icon.

3.5 Profile Screen

The Profile screen displays user account information, subscription plan details, settings options, and watchlist preview. It also supports vertical scrolling.

4 List of UI Components Designed

The following UI components were designed and organized in the CineMood Figma design system. These components were created to maintain consistency across the app screens and to make the interface reusable, scalable, and easy to update.

No.	Component	Purpose / Usage
1	Primary Button	Used for main call-to-action buttons such as *Watch Now*. It includes default, hover, active/pressed, and disabled states.
2	Secondary Button	Used for supporting actions such as *My List* and *Manage Plan*. It provides a lighter action style compared to the primary button.
3	Search Input	Used on the Browse screen for searching movies. It includes default, focused, filled, error, and disabled states.
4	Genre Dropdown	Used to filter movies by genre. It includes closed, open, selected, and disabled states. The dropdown is also interactive in the prototype and opens on tap.
5	Checkbox	Used for filters and settings such as subtitles, 4K, download on Wi-Fi only, and autoplay. It includes unchecked, checked, hover, and disabled states.

6	Mood Chip / Genre Chip	Used to display genres or content moods such as Thriller, Crime, Drama, Action, and Feel Good. Chips help users quickly identify or filter movie types.
7	Movie Poster Card	Used to display movie posters, movie titles, year, and rating. This component is used in Home, Browse, Movie Details, and Profile screens. It includes default, hover, selected, and loading states.
8	Continue Watching Card	Used on the Home screen to show partially watched content. It includes a thumbnail, movie title, progress bar, and continue time information. It includes default, hover, selected, and loading states.
9	Top Navbar	Used across all main screens for navigation. It includes the CineMood logo, Home, Movies, MyList, Search, Notification, and Profile icons. It also includes active navigation and notification states.
10	Alert / Notification	Used to show system feedback such as *Added to My List*. It includes success, warning, error, and info variants.
11	Hero Banner	Used on the Home screen to highlight a featured movie. It includes a large movie poster, dark overlay, movie title, metadata, Watch Now button, My List action, and genre chip.
12	Profile Card	Used on the Profile screen to display user information. It includes avatar initials, user name, membership status, and active badge.
13	Subscription Card	Used on the Profile screen to display the user's premium plan information. It includes plan name, plan features, monthly price, and Manage Plan button.
14	Player Controls	Used in the Video Player screen. It includes timeline, current time, play/pause button, backward and forward controls, subtitle option, settings icon, and fullscreen icon. It includes playing and paused states.

5 Component States and Variants

A major objective of this design system was to build reusable UI components with meaningful states. The components were created using Figma components and variants so that they could

be reused consistently across all app screens.

5.1 Button States

The Primary Button and Secondary Button include the following states:

- **Default:** Normal button appearance.
- **Hover:** Indicates that the user is interacting with the button.
- **Active / Pressed:** Shows that the button is being clicked or activated.
- **Disabled:** Shows that the button is unavailable.

5.2 Search Input States

The Search Input component includes:

- Default
- Focused
- Filled
- Error
- Disabled

These states help communicate input behavior clearly to users.

5.3 Dropdown States

The Genre Dropdown includes:

- Closed
- Open
- Selected
- Disabled

The dropdown was also made interactive in the prototype. When the user taps the dropdown, it opens and displays available genre options.

5.4 Checkbox States

The Checkbox component includes:

- Unchecked
- Checked
- Hover
- Disabled

It is used in both filtering and settings contexts.

5.5 Chip States

The Mood Chip / Genre Chip includes:

- Default
- Selected
- Hover
- Disabled

The chip component is used to represent movie genres and selected filters.

5.6 Card States

The Movie Poster Card and Continue Watching Card include:

- Default
- Hover
- Selected
- Loading

The selected state uses a blue border to clearly indicate selection. The loading state represents content that has not yet fully loaded.

5.7 Navigation States

The Top Navbar includes different visual states for active navigation and notification. Active menu items are highlighted using blue color, while the notification state uses an alert indicator.

5.8 Alert Types

The Alert / Notification component includes:

- Success
- Warning
- Error
- Info

Each alert type uses semantic color coding to communicate the message status.

5.9 Hero Banner

The Hero Banner is used as a featured content component. It includes movie poster imagery, title, metadata, call-to-action button, My List action, and genre chip. It helps create a strong visual entry point on the Home screen.

5.10 Profile and Subscription Cards

The Profile Card and Subscription Card were created as reusable account-related components. The Profile Card displays user identity and membership information, while the Subscription Card displays the active plan, price, and management action.

5.11 Player Control States

The Player Controls component includes:

- Playing
- Paused

This makes the video player interface more realistic and reusable.

6 Color Palette

The CineMood design system uses a blue-based color palette with light backgrounds, white surfaces, and dark navy text. The palette was selected to create a calm, clean, and modern video streaming experience.

6.1 Final Color Tokens

Color Token	Hex Code	Usage
Primary Sky	`#77CDF3`	Main call-to-action buttons and bright highlights.
Primary Sky Dark	`#0485C8`	Active states, pressed states, and strong interaction feedback.
Accent Blue	`#6AABEB`	Chips, selected filters, and secondary highlights.
Accent Blue Dark	`#176BBD`	Strong active indicators and selected states.
Primary Blue	`#38BDF8`	Progress bars, buttons, selected states, and interactive elements.
Background	`#F8FAFC`	Main app screen background.
Card Background	`#FFFFFF`	Cards, input fields, and elevated surfaces.
Text Primary	`#0F172A`	Main headings, titles, and important text.
Text Secondary	`#64748B`	Metadata, subtitles, and supporting text.
Success	`#22C55E`	Success alerts and positive confirmation.
Warning	`#F59E0B`	Warning alerts.
Error	`#EF4444`	Error alerts and destructive feedback.

Table 2: CineMood color palette

6.2 Reason for Choosing the Color Palette

A blue-based palette was chosen because blue communicates calmness, clarity, and trust. Since a streaming app is used for browsing and watching content for a longer period, the interface should feel visually comfortable and not overly distracting.

The light background color `#F8FAFC` makes the app feel clean and spacious. White cards provide separation between content blocks. The dark navy text color `#0F172A` creates strong readability on light backgrounds. The primary and accent blue colors are used for buttons, progress bars, selected cards, active navigation, and chips. Semantic colors such as green, yellow, and red were reserved for alerts and feedback.

7 Typography

The typography system uses clean sans-serif fonts to maintain readability and hierarchy.

Typography Role	Font	Usage
Display	Inter / Sora	Large hero titles and major visual headings.
H1	Inter / Sora	Main screen headings.
H2	Inter	Section headings such as Trending Now and Recommended for You.
Body	Inter	Paragraphs, storyline, and normal UI text.
Small	Inter	Metadata, time, duration, rating, and secondary information.
Caption	Inter	Badges, labels, and small UI text.

Table 3: CineMood typography system

7.1 Reason for Typography Choice

Inter was selected as the primary font because it is clean, readable, and suitable for mobile UI design. It works well for both headings and small metadata. Sora or Inter heading styles were used for larger titles to create a clear visual hierarchy.

8 Icons

Icons were used from **Lucide**. Lucide icons were selected because they are simple, lightweight, and consistent with the modern UI style of CineMood.

Icons were used for:

- Search
- Notification
- Profile
- Back navigation
- Play / Pause
- Video player controls
- Settings
- Fullscreen

9 Images and Movie Content

Official movie poster references were used for educational UI mockup purposes only. These images helped make the app screens look closer to a realistic video streaming interface.

The movie poster references used include:

- *The Godfather*
- *The Dark Knight*
- *Inception*
- *Interstellar*

The app also includes movie-focused content such as movie cards, movie details, watchlist preview, and video playback interface.

10 Inspiration and Resources

The main visual direction of CineMood was developed from personal imagination and original design decisions. The goal was to create a unique mobile streaming interface rather than directly copying existing platforms.

However, the design was informed by common video streaming interaction patterns, such as:

- Featured movie section on the Home screen.
- Browse and search experience.
- Movie details page.
- Watchlist action.
- Video player interface.

The following resources were used:

- YouTube tutorials for learning Figma components, variants, and prototype interactions.
- Google search/tutorial resources for UI layout and component design.
- Lucide icon library for icons.
- General component-state ideas from modern design systems such as Google Material Design and Apple Human Interface Guidelines.
- General streaming-app patterns inspired by Netflix and Amazon Prime Video, without copying their exact visual style.

11 Prototype Interactions

A working Figma prototype was created to demonstrate the app flow. The following interactions were implemented and tested:

- Home → Browse
- Home → Movie Details
- Home → Video Player
- Home → Profile
- Browse → Movie Details
- Movie Details → Video Player
- Video Player → Movie Details
- Profile → Home / Browse
- Dropdown opens on tap
- Browse and Profile pages support vertical scrolling

The prototype starts from the Home screen and allows the user to move through the major app sections.

12 Accessibility Considerations

Several accessibility considerations were applied in the design.

12.1 Readable Contrast

Dark navy text was used on light backgrounds to improve readability. Important headings and actions use strong contrast so users can clearly identify content and actions.

12.2 Clear Interaction States

Buttons, dropdowns, checkboxes, cards, chips, and player controls were designed with clear visual states. These states help users understand whether an element is active, selected, disabled, loading, or interactive.

12.3 Consistent Visual Hierarchy

Typography sizes, weights, and spacing were used consistently. This helps users scan the interface quickly and understand the importance of different content sections.

12.4 Touch-Friendly Design

The app was designed for a mobile frame, so buttons, cards, chips, and player controls were sized and spaced to support touch interaction.

12.5 Scrollable Content

The Browse and Profile screens support vertical scrolling. This creates a realistic mobile experience and avoids overcrowding the screen.

12.6 Color and Shape Combined

Selected states are not shown only by color. Some selected components also use borders or stronger visual shapes. For example, selected movie cards use a blue border, and selected chips use a stronger blue fill.

13 Design Challenges

Several challenges were faced while designing the CineMood system.

13.1 Free Figma Page Limitation

One challenge was working within the free Figma plan, where the number of pages is limited. To solve this, the file was organized into combined pages:

- Foundations and Components
- App Screens and Prototype
- Report / PDF frames

This helped keep the design system organized while staying within the available Figma limitations.

13.2 Creating Reusable Components

Another challenge was building proper reusable components with variants. This was solved by creating component sets for buttons, search input, dropdown, checkbox, cards, alerts, chips, navigation, and player controls.

13.3 Maintaining Mobile Layout

The app was designed for an iPhone 17 frame size of 402×874 px. Because of the limited mobile screen space, components had to be carefully resized and arranged to maintain readability.

13.4 Improving Placeholder Design

At first, many parts of the interface used simple placeholders. Later, movie poster images and realistic movie titles were added to make the interface feel closer to a real streaming app.

13.5 Managing Prototype Connections

The prototype included multiple screens and interactions. To keep the prototype clear, only one main starting flow was used from the Home screen, and important navigation actions were connected.

14 Additional Notes

CineMood was designed as a custom mobile-first streaming app. The design system focuses on clarity, reusability, and consistency. It does not directly copy existing apps. Instead, it applies a custom blue-based visual system, simple navigation, rounded cards, readable typography, and reusable components.

The final Figma file includes foundations, organized components, component variants, final app screens, scrollable mobile pages, and a working prototype.

15 Conclusion

CineMood is a complete mobile design system for a video streaming application. It includes a consistent color palette, typography system, icon usage, reusable UI components, component states, app screens, and prototype interactions.

The final design meets the requirements of the UI/UX Design Lab task by including buttons, dropdowns, checkboxes, cards, navigation elements, alerts, typography, color palette, icons, organized Figma components, final app pages, and a working prototype.
